

Rodrigo Horvilleur Vallejos

Software Engineer | Full-Stack Developer

Curridabat, San José, Costa Rica | +506 6026-1200 | rodrixdere@gmail.com | rodrixdere.com | github.com/rodrixdere | linkedin.com/in/rodrigo-horvilleur

SUMMARY

I build web applications end to end and stay with them after launch, from working out what an organisation needs through to the server the system runs on. Most of my work has been React and Next.js on the front with Node.js or Python and FastAPI over PostgreSQL behind it, plus a finance product of my own that I run in production and administer myself. English C1+, Spanish native, available immediately.

EXPERIENCE

Selected university and client projects. Fundación Curridabat was completed as a TCU community service placement.

WorldCom de Costa Rica, San José, Costa Rica

Full-Stack Developer | Jun 2026 - Jul 2026

- Replaced a manual finance process with an internal system for corporate expense reports. A report travels through a **five-role approval chain**, comes out as a PDF once approved, and warns the people responsible by email as the payment deadline approaches.
- Designed the 12-table model around status history rather than a single current state, so any report can be read back exactly as it stood on a past date. Written in PHP 8.4 over MySQL with a hand-built MVC and prepared statements, no framework.

Fundación Curridabat, San José, Costa Rica

Full-Stack Developer (TCU) | Jan 2026 - Mar 2026

- Turned a paper form into a platform that **around 150 people use every day**, delivered in under eight weeks against a three-month estimate as the only engineer on it. I gathered the requirements with the staff who would end up using it and released every week, so each round of feedback made it into the next version.
- Settled the access model before building any screens: three roles enforced in the API over JWT authentication rather than hidden in the interface. React, Vite and Tailwind on the front, Node.js and Express over PostgreSQL behind it, and I kept maintaining it after launch.

George Angulo Fitness, San José, Costa Rica

Frontend Developer | Aug 2025 - Dec 2025

- Built a multi-page brand site in React with three classmates. I designed the interface and built it with two of them, and worked on the webhook and the CMS so the client could change and add content without coming back to us.

SELECTED PROJECTS

Cabinance, personal finance SaaS in production | cabinance.app

- A finance product I built and operate on my own: Next.js on the front, Python and FastAPI over PostgreSQL, running on a Linux VPS I administer, deployed with Docker behind Cloudflare and rebuilt by CI on every push.
- The **139 automated tests** sit where a product holding money and identity actually breaks: data isolation between users, sessions invalidated when a password changes, rate limiting and resistance to account enumeration.

Cobble Labs, reference site for the Cobblemon community | cobble-lab.com

- Launched it alone on its own domain: **415 pages** generated statically and served from Cloudflare, with no backend. The game data behind them comes from an offline pipeline that reads the mod's own files, so nothing is fetched while someone is browsing.
- 77 automated tests, and the interface is checked against WCAG 2.2 across 15 widths down to 280px.

DocWizard, open-source CLI published on npm | npmjs.com/package/docwizard

- A Node.js and TypeScript command-line tool that reads a project's source code and writes the plain-language guide for end users that most projects never get around to writing. The summarising runs through the Groq API, with its output validated before anything is written.

EDUCATION

Universidad Latina de Costa Rica, B.S. in Software Engineering | 2021 - present

Final 2 courses remaining. AWS Academy Cloud Foundations, currently preparing for the AWS Certified Cloud Practitioner exam.

TECHNICAL SKILLS

- **Languages:** TypeScript, JavaScript, Python, SQL, PHP, Java, C++, Bash
- **Frontend:** React, Next.js, Vite, Tailwind CSS, responsive design, WCAG 2.2
- **Backend:** FastAPI, Node.js, Express, SQLAlchemy, REST APIs, JWT, OAuth, NextAuth, role-based access control
- **Databases:** PostgreSQL, MySQL, Supabase, relational modelling, Alembic migrations, audit trails
- **Infrastructure:** Docker, Linux server administration, Coolify, Cloudflare, Vercel, GitHub Actions, CI/CD
- **Testing and practices:** pytest, Vitest, PHPUnit, pull requests, Agile/Scrum, Jira
